

Regenerative High Frequency Electronic Load

Avionics

CINERGIA has developed a line of Regenerative Electronic Load products capable of working in a frequency range of 360 to 900Hz. It was designed to simulate the different loads that can be found in the aircraft.

The testing of aircraft generators with variable frequency is an added difficulty. Since the regulations require a constant value of $\cos \phi$, this implies the need to vary the magnitude of the inductance during the test. Through passive elements, the cost can be very high, and we obtain discrete results.

CINERGIA's electronics loads are the best tools for this type of tests. Their easy-to-use software allows us to control all the parameters and adjust the magnitude of the current required in the test. Its Bidirectional and Regenerative Hardware based on a back-to-back power conversion topology also allows energy and power saving.

Bidirectional and Regenerative Hardware

The hardware platform is based on a Back-to-Back power conversion topology, formed by two IGBT-based power stages. The grid side stage is an Active Rectifier which produces clean sinusoidal currents with very low harmonic distortion and power factor close to one.

The EUT side stage can be configured for AC voltage source or AC current source or DC output. In AC, voltage/current are controlled by using state of the art digital Proportional-Resonant controllers. In DC, the three independent buck-boost bidirectional legs enable the separated control of three different DC voltages or currents.

Local Interface

Analogue and Digital IO ports

The isolated digital and analogue inputs/outputs permit the connection of the unit to External Controllers and Power Hardware in the Loop systems (option).

4.3" Touchscreen

Allows the local parameterization and command of the device, configuration of the communications link, plots the main signals and enables the local datalogging.

Safety First

The units integrate a local Emergency Stop pushbutton and two signals (input + output) to be connected to the laboratory interlock system. Additionally, the digital outputs can be interfaced to safety tower lights.
